Scientists estimate that the universe is about 13.7 billion years old and that our galaxy Milky Way is about 13.6 billion years old.

Everything in space, including the Milky Way, is moving. The Earth moves around the Sun, the Sun moves in the Milky Way, and the Milky Way cruises through space.

Meteorites are "space rocks", which are found on Earth after they fall from the sky.

While falling, these space rocks race through the air a hundred times faster than an airplane. Travelling this fast makes the space rocks very hot - more than 1000°C!

That's because every day there are meteoroids flying toward the moon from outer space. When these space rocks make contact with the moon, they explode like bombs, making holes on the moon's surface called moon craters.

# LUCKY THEM, MAYBE ONE DAY YOU?

The first human made object that was sent into space was the Russian satellite Sputnik, launched in 1957.

Yuri Gagarin was a Russian pilot and cosmonaut who became the first human to journey into outer space.

Neil Armstrong, an American astronaut, became the first human to step on the moon.

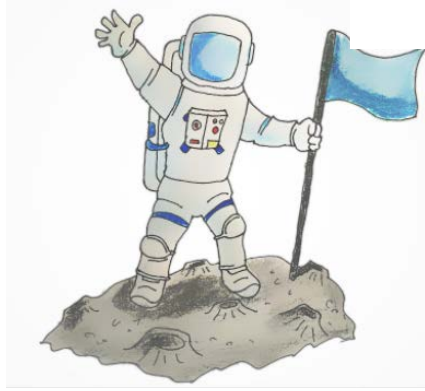

There has been no human being on Mars yet.

# WHERE SHOULD I LEAVE MY PRINT?

Forty-seven years ago, humankind took its first steps on the moon — and the bootprints will probably still be there a million years from now.

That's because the moon has no atmosphere, so there's no wind or water to sweep through and erase the marks.

## INTO SPACE

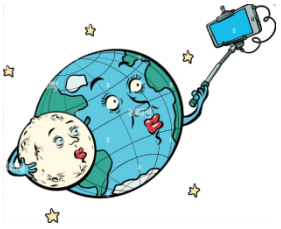

When venturing into space, astronauts wear spacesuits which have to be warmed, cooled, pressurised and supplied with fresh air.

This takes six hours for them to put on!

# WE ARE ONE

Scientists have a theory that the moon was once part of the Earth when it was a young planet.

It's thought that at one time there was a collision with a giant object that broke a piece of Earth away and as the material orbited the Earth due to gravitational pull, it eventually became the moon.
